

About me

Psychologist-turned-systems thinker with a background spanning clinical assessment, cognitive science research, and applied AI. I build frameworks that work with human behavior rather than around it. At my best, I'm translating the texture of individual human experience into insight that systems can use.

Professional Experience

Umeå university

09/2024-09/2025

Applied AI Research intern

- Designed and implemented a scalable LLM-based analysis pipeline to automatically infer psychometric constructs from natural language, validated on 245 participants across six subscales.
- Engineered systematic prompt designs (zero-shot, few-shot, chain-of-thought) to maximize construct validity and inter-rater agreement with human psychometric scores.
- Created a public benchmark dataset and submitted findings for peer review at IEEE Transactions on Affective Computing.
- Won a scholarship of 10.000 SEK from the Kempe Foundation for the initial funding.

Bergedorfer Impuls gGmbH

06/2021-09/2023

Psychologist (B.Sc.) (03/2023 – 09/2023)

- Conducted and interpreted a range of performance-related psychometric assessments (e.g., WIT, D2-R, AVEM, LMI, FERUS, IST, ISK).
- Designed and developed internal questionnaires for evaluation of social behavior.
- Supported and independently authored psychological reports, including final assessments of clients' rehabilitation potential and forward-looking recommendations.

Working student (06/2021 – 03/2023)

- Supervision of various modules in the context of a stress test for clients with a variety of psychological disorders

Education

Umeå Universitet

M.Sc. Cognitive Science (Completed 8 out of 11 modules with distinction)

09/2023- 06/2025

Master Thesis (15 ECTS): Investigated whether GPT-4 can infer intrinsic motivation scores from free-text responses using zero-shot, few-shot, and chain-of-thought prompting, validated against the Intrinsic Motivation Inventory, achieving statistically significant Spearman correlations across all six subscales. ([see](#))

Master Thesis (30 ECTS): Built a Python-based analysis pipeline integrating DeepLabCut pose estimation, K-means trajectory clustering, and sensor data synchronization to characterize motor learning stages in a rodent corticostriatal circuit study. ([see](#))

MSH – Medical School Hamburg

B.Sc. Psychology (Average grade 1,7)

03/2020 – 03/2023

Bachelor Thesis: Developed a modern analysis method to investigate negativity bias with respect to temporal mediation of information. (Grade 1.0)

Skills

Languages: German (native language), English (IELTS result: Level C1/C2), Spanish A2 (Still learning), Swedish B1

Technical: Python (Pandas, Scipy, Numpy, Pydantic, OpenAI api, Scikit-learn, Matplotlib, Seaborn), Git, VS Code, SPSS

AI: Retell.AI, n8n, Langchain, Claude code, Prompt Engineering, RAG

Design and UX: Figma, Framer, Miro, Photoshop

Research: Literature reviews, Qualitative Interviews, Psychometrics, Academic writing, Zotero
